

Snow Plow

Ice Machine Cleaner - Ready to Use

The Ice Machine Cleaner SnowPlow is the treatment for the correct and complete maintenance of equipments producing ice. Its special formulation removes limestone, debris and molds, descales the components (water tank, nozzle and coils) without damaging them, and guarantees the cleanliness of the whole machine. Its constant use also generates a protective film preventing the formation of new deposits and the growth of algae.

SnowPlow is specially designed and tested not to freeze at normal working temperatures; therefore, the product introduced into the equipment producing ice can stay in circulation during its normal use, and acts during the usual working cycle. Once it is discharged from the system, the product cleans the drain from any possible residue.

The product is formulated with "Food Grade" raw materials and without flavor, thus any possible small residue is not going to affect the quality of the ice produced.

Instructions: Fill the water tank with a dose of SnowPlow, and if necessary add more water to completely fill the container. The minimum dose required must be equal to the 50% of the total capacity of the tank; increase the quantity of product in case of particularly heavy scales.

Leave the machine working for about an hour. Discharge the product and rinse the equipment with clean water. Discard the first few batches produced.

For machines particularly encrusted, repeat the operation.
